TECHNICAL SKILLS

Cloud & IaC

AWS | Terraform

CI/CD & Automation

GitHub Actions | Git | Bash

Containers & Systems

Docker | Kubernetes | Linux

Backend & Scripting

Python | FastAPI | Pytest | Logging

Observability

Prometheus | Grafana

EDUCATION

B.Sc. Mechatronics Engineering

Federal University of Technology, Owerri

Expected Graduation: 2027

PROFILE

DevOps and Cloud Automation Engineer with hands-on, self-directed experience designing CI/CD pipelines, containerizing applications, and managing infrastructure as code. Comfortable working across the full delivery lifecycle, from writing automated tests in Python to provisioning cloud resources on AWS with Terraform. Motivated to join a remote engineering team where I can eliminate manual workflows, harden infrastructure, and build systems that stay reliable under pressure.

CORE STRENGTHS

- Designing multi-stage CI/CD pipelines with GitHub Actions to speed up ship-to-production time
- Building secure, optimized Docker images and orchestrating multi-container microservices
- Converting manual cloud configuration into version-controlled, repeatable Terraform code
- Setting up structured logging, Pytest-based test suites, and infrastructure health metrics

PROJECTS

DeployConf: Conference Registration Portal

github.com/JesFusion/DeployConf

Personal Project · Frontend/Service Architecture

- Built and containerized a registration portal for a DevOps conference, structuring the codebase into isolated frontend and service layers for modular, repeatable deployment.
- Applied DevOps-first practices from the ground up: version control, environment isolation via containerization, and a clean separation of concerns, to keep the project deployable on any machine with zero manual setup.

Additional infrastructure and automation projects currently in progress.
